1. GENERAL DESCRIPTION

1.1 OVERVIEW

This module is color active matrix LCD Open-cell incorporating amorphous silicon TFT (Thin Film Transistor). It is composed of a color TFT-LCD panel, driver ICs, PWB. Graphics and texts can be displayed on a 1920×RGB×1080 dots panel with about 16.7M colors (R/G/B 6bits+Hi FRC data in each color) by using LVDS(Low Voltage Differential Signaling) to interface, +5V of DC supply voltage.

Operating Ambient Temperature	T _{OP}	0	50	°C	(1), (2), (3)
Altitude Operating	A _{OP}	0	5000	M	(3)
Altitude Storage	A _{ST}	0	12000	M	(3)

[Note 1] Temperature and relative humidity range is shown in the figure below.

*1) 90 %RH Max. (Ta ≤ 40 °C).

*2) Wet-bulb temperature should be 40 °C Max. (Ta < 40 °C).

*3) No condensation.

[Note 2] The maximum operating temperature is based on the test condition that the surface temperature of display area is less than or equal to 50°C with LCD module alone in a temperature controlled

chamber. Thermal management should be considered in your product design to prevent the surface temperature of display area from being over 60°C. The range of operating temperature may degrade in case of improper thermal management in your product design.

[Note 3] The rating of environment is base on LCD module. Leave LCD cell alone, this environment condition can't be guaranteed. Except LCD cell, the customer has to consider the ability of other parts of LCD module and LCD module process.

2.2 ABSOLUTE RATINGS OF ENVIRONMENT (OPEN CELL)

Storage Condition: With shipping package.

$$t_5 \geq 200\text{ms}$$

※ Data: CLKIN±, RIN0±, RIN1±, RIN2±, RIN3±

※ About the relation between data input and back light lighting, please base on the above-mentioned input sequence.

※ When back light is switched on before panel operation or after a panel operation stop, it may not display normally. But this phenomenon is not based on change of an incoming signal, and does not give damage to a liquid crystal display.

※ VCC-dip conditions:

(1) When $3.6\text{V} \leq \text{VCC}(\text{min}) < 4.5\text{V}$, $t_d \leq 10\text{ms}$

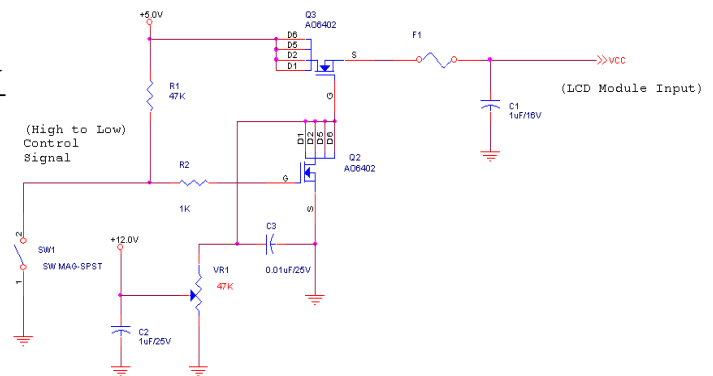

(2) When $\text{VCC} < 3.6\text{V}$, VCC-dip conditions should also follow the VCC-turn-on conditions.

[Note2]

IRush Measurement Condition:

The duration of rising time of power input is 470us.

*These values are measured with CPL standard back light unit.

* The optical characteristics are measured using the following equipment.

Measurement of viewing angle range, Response time.

Measurement of Contrast, Luminance, Chromaticity.

[Note 1] Definitions of viewing angle range:

[Note 2] Definition of contrast ratio:

The contrast ratio is defined as the following.

$$\text{Contrast Ratio} = \frac{\text{Luminance (Brightness) with white screen}}{\text{Luminance (Brightness) with black screen}}$$

[Note 3] Definition of response time

The output signals of photo detector are measured when the input signals are changed from "Full Black" to "Full White" (rising time, TR), and from "Full White" to "Full Black" (falling time, TF), respectively. The response time is interval between the 10% and 90% (1 frame at 60 Hz) of amplitudes.

$$\text{Response time} = \text{TR} + \text{TF}$$

[Note 4] This shall be measured at center of the screen.

6.2 FLICKER ADJUSTMENT

(a) Adjustment Pattern: 2H1V Checker pattern as follow:

(b) Adjustment Method:

Flicker should be adjusted by turning the volume for flicker adjustment by the ceramic driver. It is adjusted to the point with least flickering of the whole screen. After making it surely overrun at once, it should be adjusted to the optimum point.

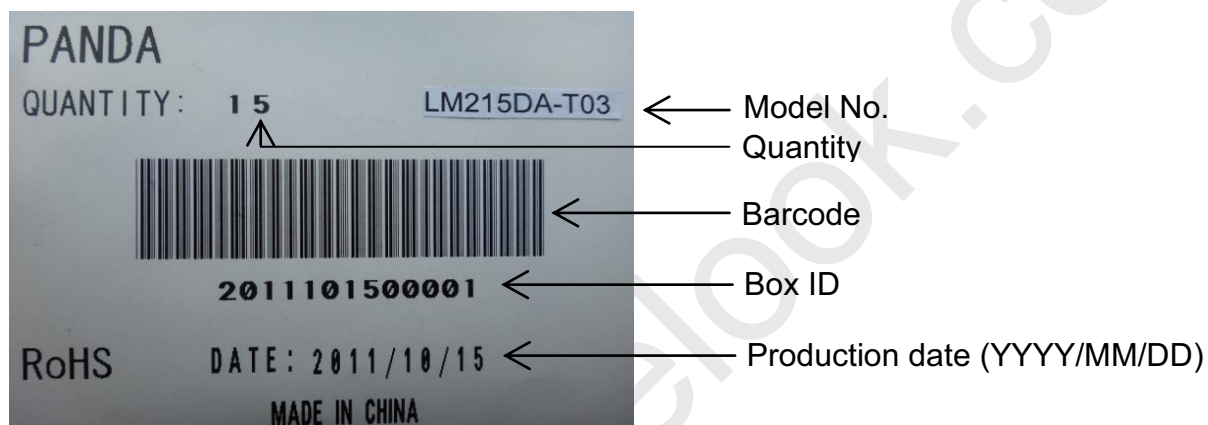

7. DEFINITION OF LABELS

7.1 OPEN CELL LABEL

8.2 PACKING METHOD

9. PRECAUTIONS

- (a) Because the Open-Cell is too weak to destroy by static electricity, please don't touch the terminal with bare hands.
- (b) Front polarizer can easily be damaged. Pay attention on it.
- (c) Since long contact with drops of water may cause discoloration or spots, please wipe off them as soon as possible.
- (d) When the panel surface is soiled, wipe it with absorbent cotton or other soft cloth.
- (e) The Panel will be broken or chipped when it is dropped or bumped against a hard substance.
- (f) Precautions of peeling off the Protection Film:
 - *1) Be sure to peel off slowly (recommended more than 7 sec.) and constant speed.
 - *2) Peeling direction shown in the next Fig.
 - *3) Be sure to ground person with adequate methods such as the anti-static wrist band.
 - *4) Be sure to connect S-PWBs to GND while peeling off the protection film.
 - *5) Ionized air should be blown to the surface while peeling off the protection film.
 - *6) The protection film must not touch drivers and S-PWBs.

After the protection film has been peeled off, some adhesive may be remained on the polarizer. Please use isopropyl-alcohol to remove it.

- (g) Since the Open-cell consists of TFT and electronic circuits with CMOS-ICs, which are very weak to electrostatic discharge, persons who are handling an Open-Cell should be grounded through adequate methods such as an anti-static wrist band. Connector pins should not be touched directly with bare hands.
- (h) Avoiding COF damage, do not bend PWB to display side when handling the open cell, recommend coating silicon or tuffo on front and back side of COF.

Reference: Process control standard of CPL.

	item	Management standard value and performance standard
1	Anti-static mat(shelf)	1to50 [Mega ohm]
2	Anti-static mat(floor, desk)	1to100 [Mega ohm]
3	Ionizer	Attenuate from $\pm 1000V$ to $\pm 100V$ within two seconds.
4	Anti-static wrist band	0.8 to 10 [Mega ohm]
5	Anti-static wrist band entry and ground resistance	Below 1000 [ohm]
6	Temperature	22 to 26 [$^{\circ}C$]
7	Humidity	60 to 70 [%]

- (i) Since the Open-cell has some PWBS, please take care to keep them off any stress or pressure when handling or installing the Open-cell, otherwise some of electronic parts on them may be damaged.
- (j) Be sure to turn off the power supply when inserting or disconnecting the cable.
- (k) Be sure to design the module and cabinet so that the Open-cell can be installed without any extra stress such as warp or twist.
- (l) When handling and assembling Open-Cell into module, please be noted that long-term storage in the environment of oxidation or deoxidization gas and the use of materials such as reagent, solvent, adhesive, resin... etc, which generate these gasses, may cause corrosion and discoloration of the Open-Cell.
- (m) Applying too much force and stress to PWBs and drivers may cause a malfunction electrically and mechanically.
- (n) The Open-cell has high frequency circuits. Sufficient suppression to EMI should be done by system manufactures.
- (o) Please be careful since image retention may occur when a fixed pattern is displayed for a long time.
- (p) The chemical compound, which causes the destruction of ozone layer, is not being used.
- (q) This Open-Cell module is corresponded to RoHS.
- (r) When any question or issue occurs, it shall be solved by mutual discussion.
